

1. Which are the top three variables in your model which contribute most towards the probability of a lead getting converted?

Solution :

-  Total Time Spent on Website
-  Lead Add Form (from Lead Origin)
-  Had a Phone Conversation ( from Last Notable Activity)

2. What are the top 3 categorical/dummy variables in the model which should be focused the most on in order to increase the probability of lead conversion?

Solution :

- Total Time Spent on Website
- Page Views Per Visit
- Total Visits

3. X Education has a period of 2 months every year during which they hire some interns. The sales team, in particular, has around 10 interns allotted to them. So during this phase, they wish to make the lead conversion more aggressive. So they want almost all of the potential leads (i.e. the customers who have been predicted as 1 by the model) to be converted and hence, want to make phone calls to as much of such people as possible. Suggest a good strategy they should employ at this stage.

Solution: The final prediction is calculated based on a optimal cut off value of 0.35. In order to make the sales aggressive, the company may contact all the leads which have a conversion probability.

4. Similarly, at times, the company reaches its target for a quarter before the deadline. During this time, the company wants the sales team to focus on some new work as well. So during this time, the company's aim is to not make phone calls unless it's extremely necessary, i.e. they want to minimize the rate of useless phone calls. Suggest a strategy they should employ at this stage.

Solution: As we have our recall score with cutoff of 0.35, the true relevant result is better hence the useless phone calls will be reduced and we can get a understanding between a hot lead and a cold lead.
